Recent reforms in statistics education have called for a shift away from the traditional emphasis on procedures and calculations, to a more balanced emphasis on both conceptual and procedural knowledge. Although little research has addressed ways to promote conceptual learning of statistics, it may be possible to adapt ideas from research on mathematical thinking to develop methods for fostering knowledge of statistics concepts. Building on research on mathematics learning, the current study explored two factors hypothesized to affect students' acquisition of conceptual knowledge in statistics: the order in which related concepts are introduced, and the opportunity to compare related concepts. This dissertation investigated these factors in the context of a lesson on confidence intervals (CIs), which are a difficult statistical concept that require both procedural and conceptual knowledge. The lessons focused on two ways to interpret CIs: one based on estimation, which emphasized underlying concepts, and one based on null hypothesis significance testing (NHST), which emphasized the procedure for determining significance. Participants were randomly assigned to one of four lesson conditions, which differed in the order in which the two approaches to CIs were presented (NHST-first vs. estimation-first) and the presence/absence of concept comparison. Participants completed a pretest measure of CI knowledge and then viewed their assigned lesson. After viewing the lessons, participants completed a posttest knowledge assessment. I predicted that participants would have low levels of baseline conceptual knowledge. Further, I predicted that, if order of presentation mattered, participants seeing NHST presented first would learn less than participants seeing estimation presented first. Finally, I predicted that comparison would positively affect learning. As expected, students had poor pretest conceptual knowledge. After viewing the lessons, participants made significant gains on the posttest measures. There was no effect of the order in which the information was presented. Comparison influenced learning of some CI concepts; specifically, those explicitly referenced during the comparison. These findings extend past research on comparison in learning to a new domain (statistics), a new type of comparison (between interpretations), and to instructor-led comparisons. The current study suggests that comparison may be a valuable tool for fostering conceptual statistics knowledge.

Develop students ' critical thinking, abstract reasoning, and creative learning skills with concept-based teaching! Take learning beyond the facts with a teaching approach that develops conceptual thinking and problem-solving skills. A Concept-Based curriculum recaptures students ' innate curiosity about the world and provides the thrilling feeling of using one 's mind well. Concept-Based teachers will learn how to: Meet the demands of rigorous academic standards Use the Structure of Knowledge and Process when designing disciplinary units Engage students in inquiry through inductive teaching Identify conceptual lenses and craft quality generalizations

Teach higher-order thinking while you 're teaching concepts, skills, and content! This indispensable guide combines proven curriculum design with teaching methods that encourage students to learn concepts as well as content and skills for deep understanding across all subject areas. Synthesizing Lynn Erickson 's past 15 years of field work with teachers, curriculum developers, teacher educators, and instructional leaders, this resource offers a complete guide for designing curriculum and instruction to foster the continuous growth and development of students ' critical, abstract, and creative learning skills. Educators will learn how to: Bring coherence and clarity to high-quality curriculum design and instructional planning Teach the way that students ' minds learn best Encourage students ' creative and abstract thinking, regardless of level or subject area Gain the support of principals and district administrators

Creating Your Teaching Plan: A Guide for Effective Teaching was written to provide you with numerous practical, research-based ideas which you can use in your particular classroom setting. It contains tried and tested strategies to help you be successful, whether you're a new teacher, one returning after an absence, or an experienced teacher looking for new methods. This worktext is organized around five critical areas necessary for successful teaching: [Starting the Year [Planning [Monitoring and Assessing Learning [Managing the Classroom [Enhancing Reading/Literacy Skills After you have completed the activities in this worktext, you will have a written plan for starting your year. This is not a guarantee that the year will be easy or successful, but you will have developed the foundation necessary to enhance student learning.

Procedural and conceptual knowledge are important to mathematics achievement as well as mathematical self-efficacy and attitudes towards mathematics. The purpose of this study was to investigate the relationship between undergraduates' procedural and conceptual knowledge specific to fractions and their general mathematical self-efficacy and positive attitudes towards mathematics. The participants were 64 undergraduates who were assessed based on their procedural and conceptual knowledge of fractions as well as their mathematical self-efficacy and attitudes towards mathematics. The results revealed that both procedural and conceptual knowledge of fractions were related to mathematical self-efficacy and attitudes towards mathematics. However, the relationship with conceptual knowledge was stronger. The results suggest that understanding mathematical concepts is related to confidence in mathematics abilities and attitudes towards mathematics that have been associated with students pursuing degrees in STEM majors. It is necessary for future research to study this relationship in younger age groups from elementary school students to high school students.

Now in a completely revised and expanded second edition, this authoritative handbook reviews the breadth of current knowledge on the psychological processes that underlie social behavior. Leading investigators identify core principles that have emerged from the study of biological systems, social cognition, goals and strivings, interpersonal interactions, and group and cultural dynamics. State-of-the-science theories, methods, and findings are explained, and important directions for future research are highlighted. More than an update, this edition is virtually a new book. Many more chapters are included, and significant advances in social cognitive neuroscience, motivational psychology, and other areas are incorporated throughout. A new section addresses implications for applied domains, such as clinical psychology, health, and consumer behavior.

Have you ever thought that you don't think the same way that other do? Have you ever listened to someone talk and thought that the person was not telling you what you needed to know? Well, you are not only alone. This happens to everyone because everyone thinks differently. The information that is important to one person is not always important to another. This book is a short introduction to how an individual's thought process determines the types of information that their mind processes. The reader will be introduced to the differences between thinking conceptually and procedurally, how these differences affect many areas of a person 's life, and how an individual can identify their style of thinking.

Fully revised and updated, this second edition updates Novak 's theory for meaningful learning and autonomous knowledge-building along with tools to make it operational – that is, concept maps, created with the use of CMapTools and the V diagram. It is essential reading for educators at all levels and corporate managers who seek to enhance worker productivity.
