In this major new study, Mark Edward Lewis traces how the changing language of honor and shame helped to articulate and justify transformations in Chinese society between the Warring States and the end of the Han dynasty. Through careful examination of a wide variety of texts, he demonstrates how honor-shame discourse justified the actions of diverse and potentially rival groups. Over centuries, the formally recognized political order came to be intertwined with groups articulating alternative models of honor. These groups both participated in the existing order and, through their own visions of what was truly honourable, paved the way for subsequent political structures. Filling a major lacuna in the study of early China, Lewis presents ways in which the early

More than 90 individual minerals and materials are covered by two-page synopses. For mineral commodities for which there is a Government stockpile, detailed information concerning the stockpile status is also included in the two-page synopsis.

Clinical Chemistry considers what happens to the body's chemistry when affected by disease. It provides introductory coverage of the scientific basis for biochemistry tests routinely used in medicine - including tests for the assessment of organ function, diagnosis and monitoring disease activity and therapy efficacy. Each topic area begins with a concise description of the underlying physiological

Zeolites occur in nature and have been known for almost 250 years as aluminosilicate minerals. Examples are clinoptilolite, mordenite, offretite, ferrierite, erionite and chabazite. Today, most of these and many other zeolites are of great interest in heterogeneous catalysis, yet their naturally occurring forms are of limited value as catalysts because nature has not optimized their properties for catalytic applications and the naturally occurring zeolites almost always

contain undesired impurity phases. It was only with the advent of synthetic zeolites in the period from about 1948 to 1959 (thanks to the pioneering work of R. M. Barrer and R. M. Milton) that this class of porous materials began to play a role in catalysis. A landmark event was the introduction of synthetic faujasites (zeolite X at first, zeolite Y slightly later) as catalysts in fluid catalytic cracking (FCC) of heavy petroleum distillates in 1962, one of the most important chemical processes with a worldwide capacity of the order of 500 million t/a. Compared to the previously used amorphous silica-alumina catalysts, the zeolites were not only orders of magnitude more active, which enabled drastic process engineering improvements to be made, but they also brought about a significant increase in the yield of the target product, viz. motor gasoline. With the huge FCC capacity worldwide, the added value

of this yield enhancement is of the order of 10 billion US \$ per year.
